Web Services & SOA Laboratory

Lab 1 Assignment: CampusConnect – Smart University Service Portal

Scenario

You have joined a software company as a Frontend Developer. The backend team is developing Web Services and APIs for a university portal. Your responsibility is to build an interactive frontend prototype using HTML, CSS and JavaScript with mock data. The interface should be ready for future integration with Web Services.

Objective

Build a responsive dashboard-style Campus Service Portal using semantic HTML, external CSS and JavaScript.

Task Requirements

Create:
• Navigation Bar (Logo, CampusConnect, Home, Services, Dashboard, Notifications, Profile)
• Welcome Section (Student Name, ID, Department, Semester)
• Summary Cards (Attendance, Courses, Assignments, Exams, CGPA, Notifications)
• Today's Timetable
• Recent Announcements
• Upcoming Events
• Quick Services (Attendance, Registration, Fee Payment, Transcript, Library, Timetable)
• Footer (Contact, Help Desk, Privacy Policy)

JavaScript

Implement at least THREE features: Theme Switch, Greeting based on time, Current Date/Time, Search or Filter, Expand/Collapse announcements, Notification counter, Show/Hide sections.

Styling

Use external CSS only. Create a modern dashboard with cards, proper spacing, typography, hover effects and responsive layout.

Project Structure

CampusConnect/
index.html
css/style.css
js/script.js
assets/
README.md

Future Service Mapping

In README, create a table mapping UI components to future APIs. Example: Attendance → GET /attendance, Courses → GET /courses, Announcements → GET /announcements, Fee Payment → POST /payment.

Learning Outcomes

Understand semantic HTML, CSS layouts, DOM manipulation, JavaScript interactions, project organization and how frontends are prepared before backend Web Services are available.
